OVERVIEW

The Expelee team has performed a line-by-line manual analysis and automated review of the smart contract. The smart contract was analysed mainly for common smart contract vulnerabilities, exploits, and manipulation hacks. According to the smart contract audit:

Audit Result	Passed
Audit Date	29 August 2024

CONTRACT DETAILS

Token Address: 0xb6551900d7FB1b51ebb29FA0143a6EBf0FB0D47F

Name: Eutopia

Symbol: EUTO

Decimals: 18

Network: Ether Scan

Token Type: ERC1967Proxy

Owner: 0x3F7a733857300043E9c9E2707836dD5d272415cd

Token Supply: 4,000,000,000

Checksum: 5bb72de43a65baf58885adfc77e0c9ad

AUDIT METHODOLOGY

Audit Details

Our comprehensive audit report provides a full overview of the audited system's architecture, smart contract codebase, and details on any vulnerabilities found within the system.

Audit Goals

The audit goal is to ensure that the project is built to protect investors and users, preventing potentially catastrophic vulnerabilities after launch, that lead to scams and rugpulls.

Code Quality

Our analysis includes both automatic tests and manual code analysis for the following aspects:

- Exploits
- Back-doors
- Vulnerability
- Accuracy
- Readability

Tools

- Manual Review: The code has undergone a line-by-line review by the Ace team.
- BSC Test Network: All tests were conducted on the BSC Test network, and each test has a corresponding transaction attached to it. These tests can be found in the "Functional Tests" section of the report.
- Slither: The code has undergone static analysis using Slither.

VULNERABILITY CHECKS

Design Logic	Passed
Compiler warnings	Passed
Private user data leaks	Passed
Timestamps dependence	Passed
Integer overflow and underflow	Passed
Race conditions & reentrancy. Cross-function race conditions	Passed
Possible delays in data delivery	Passed
Oracle calls	Passed
Front Running	Passed
DoS with Revert	Passed
DoS with block gas limit	Passed
Methods execution permissions	Passed
Economy model	Passed
Impact of the exchange rate on the logic	Passed
Malicious event log	Passed
Scoping and declarations	Passed
Uninitialized storage pointers	Passed
Arithmetic accuracy	Passed
Cross-function race conditions	Passed
Safe Zepplin module	Passed

RISK CLASSIFICATION

When performing smart contract audits, our specialists look for known vulnerabilities as well as logical and access control issues within the code. The exploitation of these issues by malicious actors may cause serious financial damage to projects that failed to get an audit in time. We categorize these vulnerabilities by the following levels:

High Risk

Issues on this level are critical to the smart contract's performance/functionality and should be fixed before moving to a live environment.

Medium Risk

Issues on this level are critical to the smart contract's performance/functionality and should be fixed before moving to a live environment.

Low Risk

Issues on this level are minor details and warnings that can remain unfixed.

Informational

Issues on this level are minor details and warnings that can remain unfixed.

INHERITANCE TREE

MANUAL REVIEW

Severity Criteria

Expelee assesses the severity of disclosed vulnerabilities according to methodology based on OWASP standarts.

Vulnerabilities are dividend into three primary risk categorieis:

High

Medium

Low

High-level considerations for vulnerabilities span the following key areas when conducting assessments:

- Malicious input handling
- Escalation of privileges
- Arithmetic
- Gas use

Overall Risk Severity				
Impact	HIGH	Medium	High	Critical
	MEDIUM	Low	Medium	High
	LOW	Note	Low	Medium
		LOW	MEDIUM	HIGH
	Likelihood			

MEDIUM RISK FINDING

Centralization – Ownership of Proxy and Implementation contract.

Severity: Medium

Overview: The owner has renounced the ownership of the implementation contract but didn't renounce the ownership of the proxy contract. Which can lead to concern by manipulating the functionality of implementation contract through proxy contract.

Suggestion: Make sure the owner has to renounce the ownership of the proxy contract.

MEDIUM RISK FINDING

Centralization – Missing Require Check.

Severity: Medium

Function: setFeeReceivers

Status: Open

Overview:

The owner can set any arbitrary address including zero address as this is not recommended because if the owner sets the address to the contract address, then the ETH will not be sent to that address and the transaction will fail, leading to a potential honeypot in the contract.

```
function setFeeReceivers(
    address _liquidityReceiver,
    address _treasuryReceiver,
    address _essrReceiver
) external onlyOwner {
    liquidityReceiver = _liquidityReceiver;
    treasuryReceiver = _treasuryReceiver;
    essrReceiver = _essrReceiver;
    emit SetFeeReceivers(
        _liquidityReceiver,
        _treasuryReceiver,
        _essrReceiver
    );
}
```

Suggestion: It is recommended that the address should not be able to set as a contract address.

MEDIUM RISK FINDING

Centralization – Liquidity is added to EOA.

Severity: Medium

function: `_addLiquidity`

Status: Open

Overview:

Liquidity is added to EOA. It may be drained by the liquidityReceiver.

```
function _addLiquidity(uint256 _tokenAmount, uint256 _ethAmount)
private {
    uniswapRouter.addLiquidityETH{value: _ethAmount}(
address(this),
    _tokenAmount,
    0,
    0,
    liquidityReceiver,
    block.timestamp
    );
}
```

Suggestion:

It is suggested that the address should be a contract address or a dead address.

LOW RISK FINDING

Centralization – Missing Zero Address

Severity: **Low**

Subject: **Zero Check**

Status: **Open**

Overview:

functions can take a zero address as a parameter (0x00000...). If a function parameter of address type is not properly validated by checking for zero addresses, there could be serious consequences for the contract's functionality.

```
function setFeeReceivers(  
    address _liquidityReceiver,  
    address _treasuryReceiver,  
    address _essrReceiver  
    ) external onlyOwner {  
    liquidityReceiver = _liquidityReceiver;  
    treasuryReceiver = _treasuryReceiver;  
    essrReceiver = _essrReceiver;  
    emit SetFeeReceivers(  
        _liquidityReceiver,  
        _treasuryReceiver,  
        _essrReceiver  
    );  
}
```

Suggestion:

It is suggested that the address should not be zero or dead.

OPTIMIZATION

optimization

severity: Optimization

Subject: Remove unused code.

Status: Open

Overview: Unused variables are allowed in Solidity, and they do not pose a direct security issue. It is the best practice, though, to avoid them.

```
function pause() public onlyOwner {  
  _pause();  
}  
function unpause() public onlyOwner {  
  _pause();  
}
```

ABOUT EXPELEE

Expelee is a product-based aspirational Web3 start-up. Coping up with numerous solutions for blockchain security and constructing a Web3 ecosystem from deal making platform to developer hosting open platform, while also developing our own commercial and sustainable blockchain.
